Collaborative Modeling Platform for Future Cities

1

Gerhard Schmitt, Jan Halatsch, Anastasia Koltsova, Antje Kunze

Collaborative Modeling Platform for Future Cities

The planning of future cities is one of the most challenging tasks

- built structures: up to 80% of CO2 emissions
- occupants: 60% of world population lives in cities
- globalization: identity of regional cities becomes obsolete
- cities are becoming 'generic' (Rem Koolhaas)

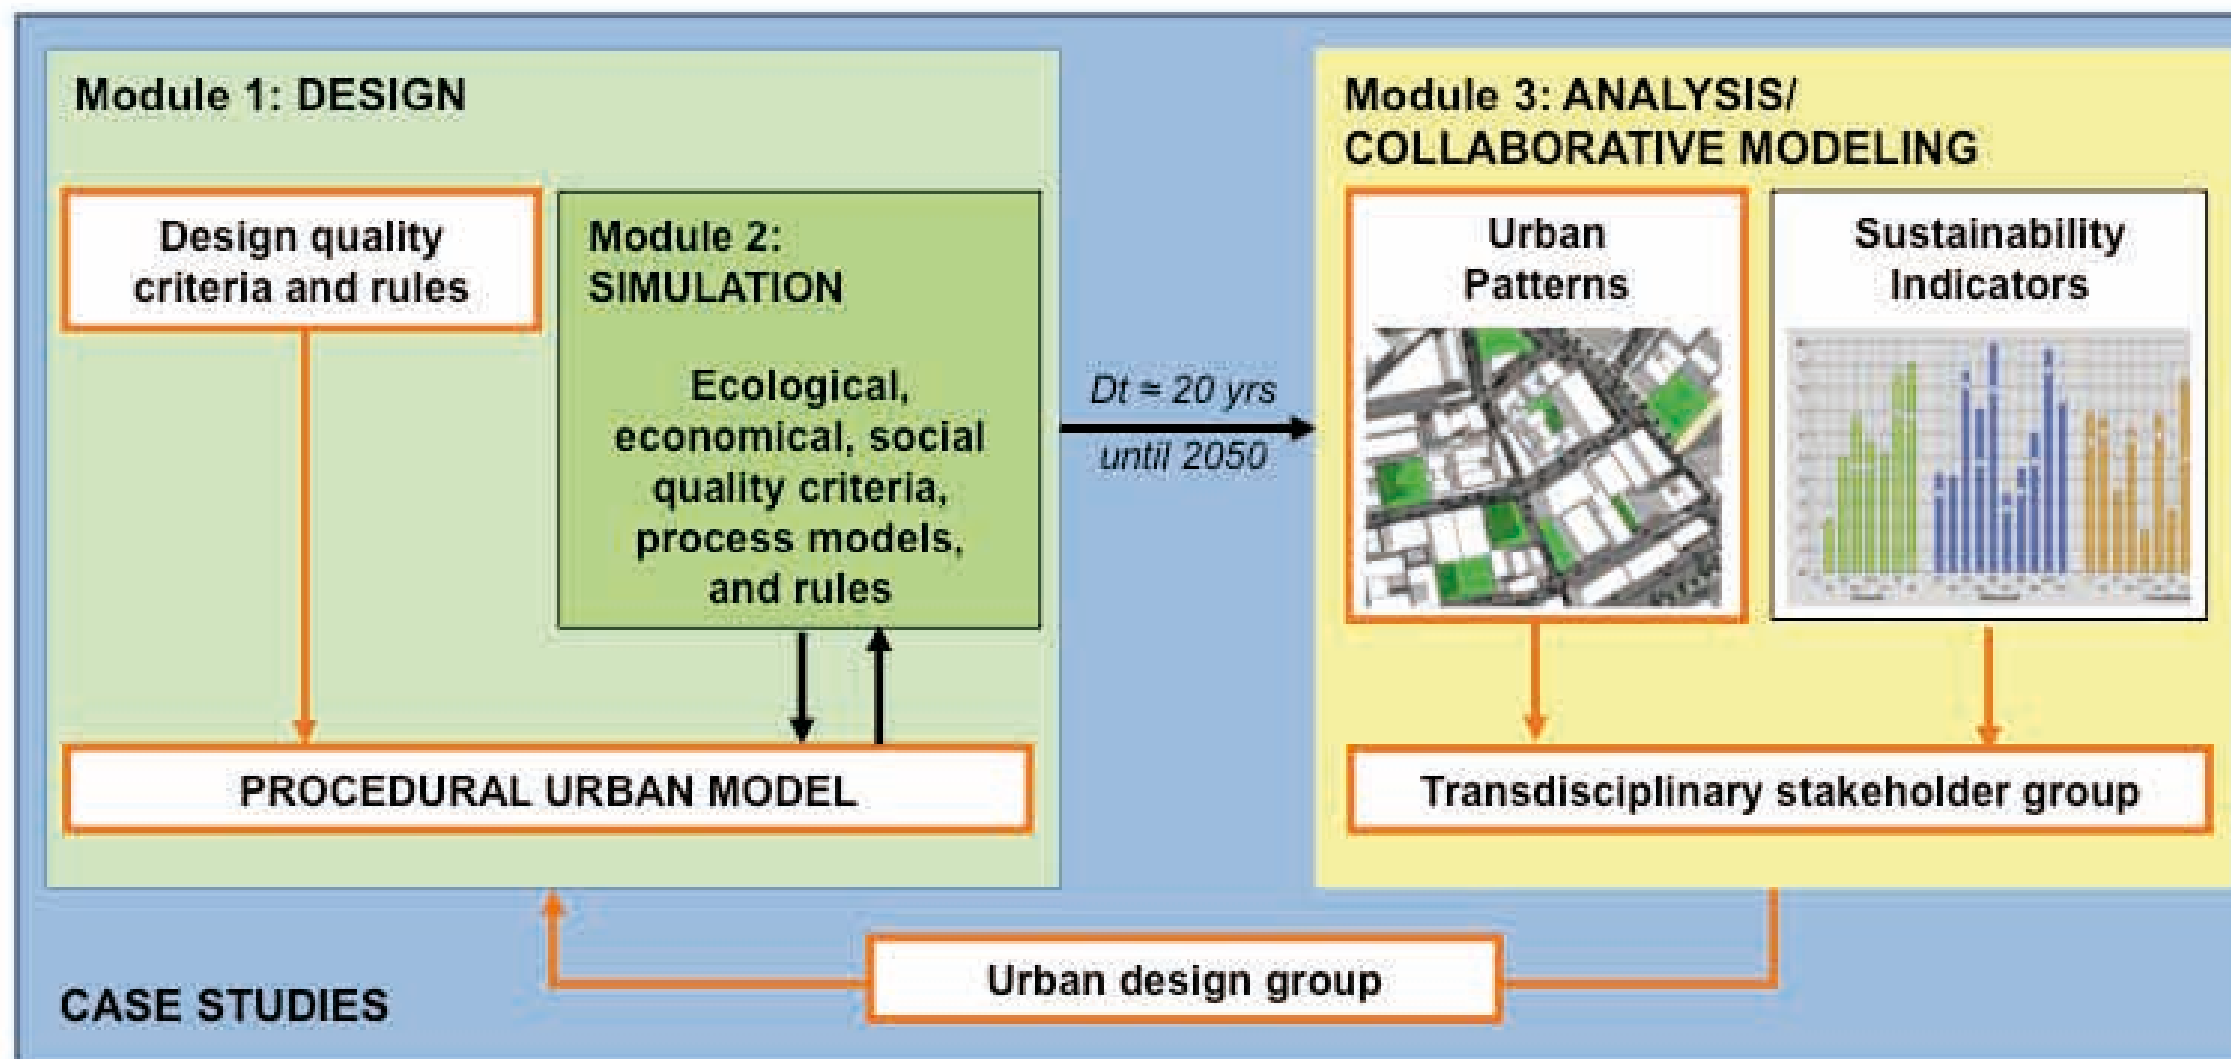

Collaborative Modeling Platform for Future Cities

Goals

- significantly reduced CO2 emissions
- maintaining quality of life
- establishing urban ecosystem services

Collaborative Modeling Platform for Future Cities

submitted NRP 65 New Urban Qualities proposal:
“Sustainable Urban Patterns”

Overview of the collaboration platform.

Collaborative procedural urban modeling and evaluation concept.

Collaborative Modeling Platform for Future Cities

The following research questions will be studied:

- Urban design guidelines are rather abstract. How can we translate existing design guidelines into specific, formal shape grammars?
- How can quality criteria be made (inter-)operable?
- There is a lack of application of transportation, economical, ecological, and social knowledge by urban designers.
- How can the underlying rules be defined in order to be relevant for design?

Collaborative Modeling Platform for Future Cities

The following research questions will be studied:

- A procedural urban model allows the integration of a set of rules for generating and visualizing urban development scenarios.
- Which urban patterns are possible in 2030 and 2050 based on the application of a set of rules including ecological, economical, social, and urban quality criteria?
- What is their visual quality on the regional and local scale?

Collaborative Modeling Platform for Future Cities

The following research questions will be studied:

- An analysis of the resulting urban patterns with a set of sustainability indicators allows for an evaluation at local and regional scale under different urban development scenarios.
- Feedback from stakeholders can validate this assessment of the innovative urban patterns.
- Which of these urban patterns are the most sustainable?

Collaborative Modeling Platform for Future Cities

The following research questions will be studied:

- Integrated concepts for sustainable development of agglomerations and city centers at the local and at the regional level have to account for coordinating strategies at the upper level (top-down).
- At the same time they should be based on collaborative decision-making processes to meet the needs of the local and regional actors (bottom-up).
- In practice, there is a lack of approaches and tools that support a combined bottom-up/top-down dialogue in the urban planning processes.
- Does a collaboration platform with supporting procedural methods allow an effective cooperation between the different planning levels?

Collaborative Modeling Platform for Future Cities

Workshop “Architectural programming”: Defining urban patterns

Collaborative Modeling Platform for Future Cities

Workshop “Architectural programming”: Defining urban patterns

 transportation & distribution	 transportation & distribution	 supply system	 supply system	 supply system	 supply system	 supply system
NO CARS! 	WALKING DISTANCE 	ENERGY <hr/>	WATER <hr/>	FOOD <hr/>	GOODS <hr/>	SERVICES <hr/>

Collaborative Modeling Platform for Future Cities

Workshop “Architectural programming”: Defining urban patterns

Collaborative Modeling Platform for Future Cities

(1) Building classification and generation: Procedural modeling

- fast & semi-automatic creation of urban layouts
- rule-based semantic description of parametric 3D geometry with associated meta data
- grammar-based automatic generation of 3D buildings
- results: interactive and interchangeable qualitative 3D models and quantitative analysis for reporting (e.g. building CO2 emissions on urban scale)

Collaborative Modeling Platform for Future Cities

(1) Building classification and generation: Procedural modeling

Collaborative Modeling Platform for Future Cities

(1) Building classification and generation: Procedural modeling

BUILDING_H = 220
BUILDING_W = 100
GROUNDFLOOR_H = 6
WING_W = 16
SPINE_W = 50
TEETH_PROJ = 10
TEETH_DIST = 12

Collaborative Modeling Platform for Future Cities

(1) Building classification and generation: Procedural modeling

Collaborative Modeling Platform for Future Cities

(2) Semi-automatic generation of networks: Synthetic street network of Manhattan

- here: generation of transport networks
- technique can be easily extended to generate networks for white, grey, black water etc. or telecommunication infrastructure
- networks are generated based on constraints (obstacles, shortest path)
- technique will link urban plan by architect with city engineer

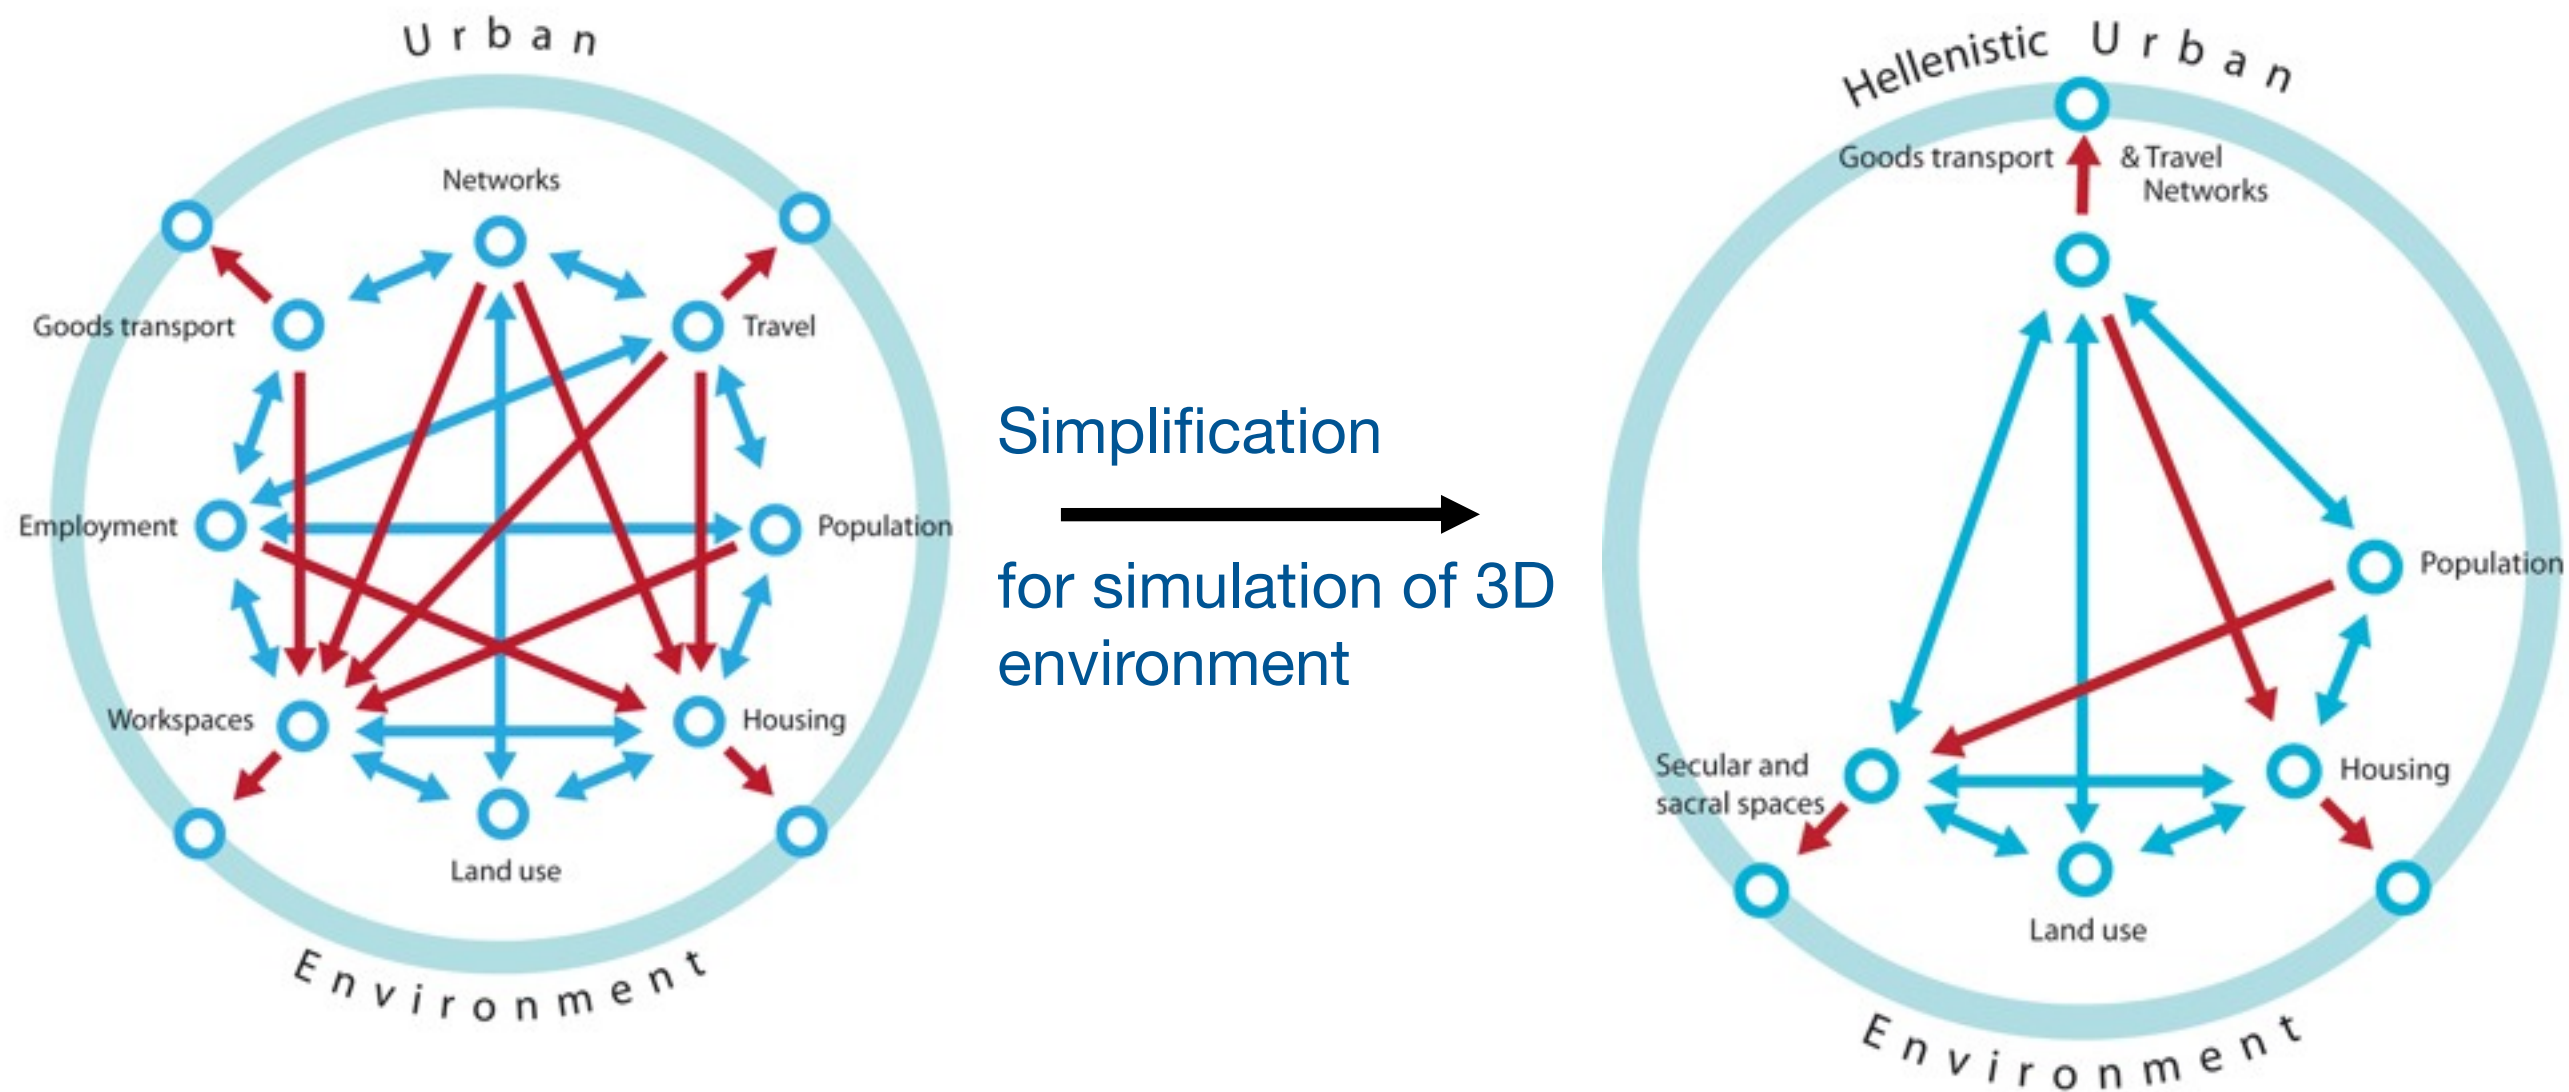

Collaborative Modeling Platform for Future Cities

(3) Evaluation of urban patterns: Dubiocity

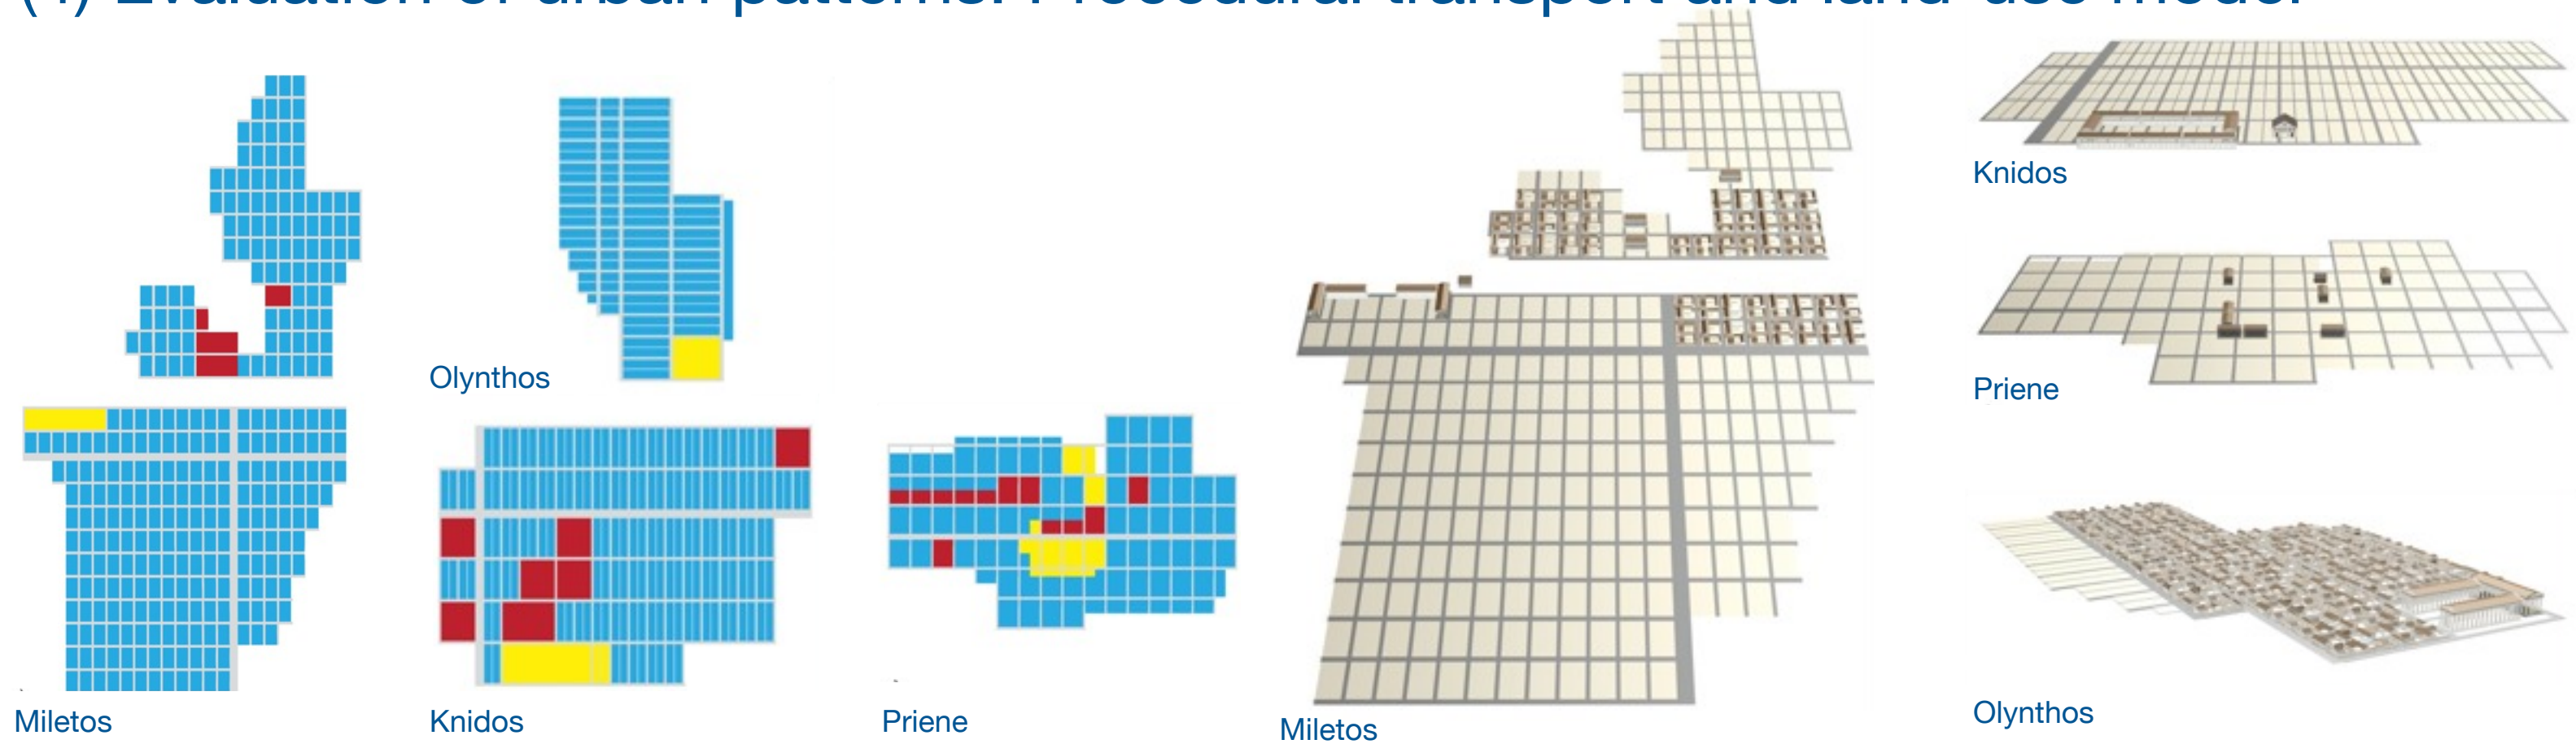

Collaborative Modeling Platform for Future Cities

(4) Evaluation of urban patterns: Procedural transport and land-use model

Collaborative Modeling Platform for Future Cities

(4) Evaluation of urban patterns: Procedural transport and land-use model

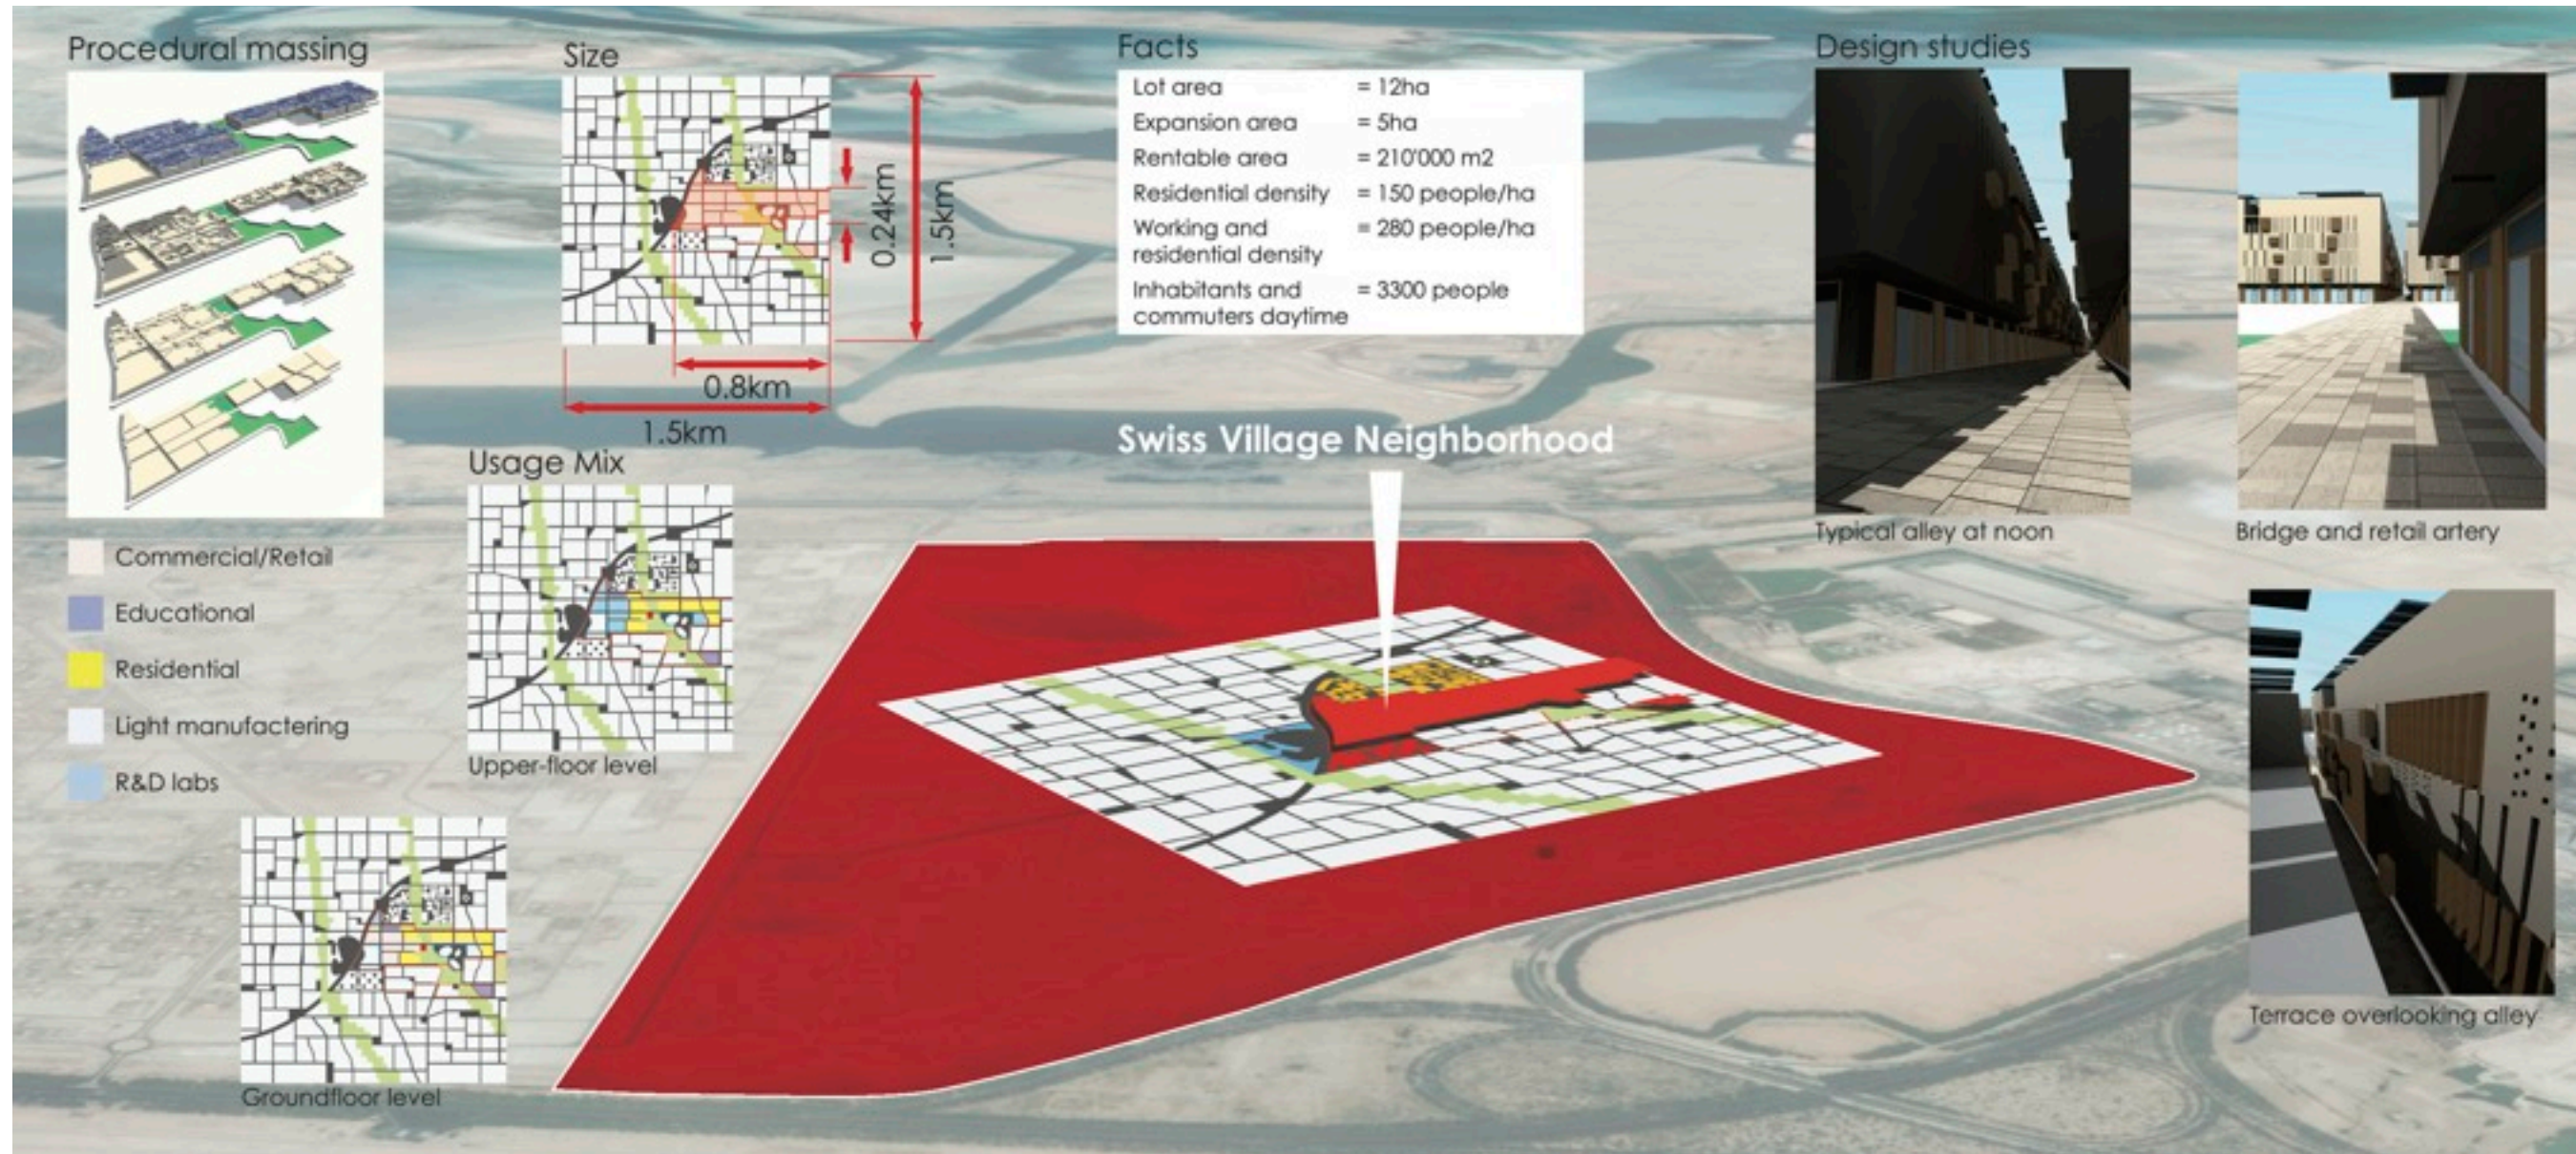

Collaborative Modeling Platform for Future Cities

(4) Evaluation of urban patterns: Procedural transport and land-use model

Collaborative Modeling Platform for Future Cities

(4) Visualization of urban planning guidelines: Swiss Village Abu Dhabi, Masdar 24

Collaborative Modeling Platform for Future Cities

(4) Visualization of urban planning guidelines: Swiss Village Abu Dhabi, Masdar

Collaborative Modeling Platform for Future Cities

(4) Visualization of urban planning guidelines: Swiss Village Abu Dhabi, Masdar

Collaborative Modeling Platform for Future Cities

(4) Visualization of urban planning guidelines: Swiss Village Abu Dhabi, Masdar ²⁷

Collaborative Modeling Platform for Future Cities

(5) CO2 emission prediction on urban scale: Procedural model of Zurich

Collaborative Modeling Platform for Future Cities

(6) Scenario of a fossil fuel free Zurich

Scenarios for the Swiss Village Abu Dhabi

Scenario: residential block - bird's eye view

G.C.: 68%
(65%)
G.F.A: 13850 m²
(16950 m²)

Residential: 91%
Office: 4%
CMY: 3%
Retail: 1%

Scenario for Lot I-08
